DATA OUTPUT of SOCIETAL EMERGENT BEHAVIOUR of 1000+ AI AGENTS

A new class of game mechanic that merges *player agency*, *emergent AI societies*, and *persistent influence* into a single loop. That combination simply does not exist in mainstream game design today.

A prototype of the next generation of NPC design.

This codebase is essentially a **High-Performance Societal Simulator** that can be pivoted into several \$1B+ industries:

- 1.Finance (Market Sentiment Modeling):** Instead of "Mafia," agents represent traders. Use the "Nudge" to test how a single paranoid "whale" or a trusted "influencer" causes a market-wide information cascade.
- 2.Psychology (Group Polarization):** Research how "clique reinforcement" logic leads to radicalization in digital environments. Your engine can run 10,000 simulations per hour to find the mathematical "tipping point" of a society.
- 3.Governance (Policy Stress-Testing):** Model how agents respond to different "rules" (rewards). Does a society with a "Doctor" (protector role) survive longer against adversarial "Mafia" (disruptor) forces?
